

Fresh-r keeps your staff sharp and healthy.

What is the biggest expense of your business? Who makes the difference? What is really irreplaceable? Your personnel.

Your colleagues. People like you and me.

If they feel good, then they perform better, and naturally, the company will also perform better.

In a recent study by **Harvard University** (*) it has been reaffirmed that the indoor climate is of direct importance to both our physical health and our ability to perform properly at work.

As you can expect these days, the Fresh-r® is WiFi connected. Either way: via a PC, tablet or Smart phone you can see what the Fresh-r® does, and that your indoor air quality is healthy.

In particular, the impact of a CO₂ ventilated workplace has been assessed against the activity based performance of personnel. This study categorically demonstrated that crisis response, strategic planning, information processing and focused activity levels will be three times better when the CO₂ levels are properly controlled by ventilation. Absenteeism also significantly decreases with an overall positive impact on productivity and output.

The researchers therefore conclude that active ventilation monitoring, and sufficiently controlling CO₂ concentration will generate substantial economic benefit. This is exactly what the Fresh-r® was designed for: CO₂ controlled ventilation focusing directly on the health and performance of your employees.

Fresh-r® works silently and is intelligent, just as you would expect of any colleague. It knows exactly what the air quality is, and always works when needed. Inside the Fresh-r® there are two fans and a heat exchanger, which makes the ventilation a lot more comfortable and energy efficient. The capacity of the Fresh-r® is 80 m³ per hour, which is enough for 4 to 5 people. The installation is simple and takes between 1 and 3 hours. It can be installed either on a wall, or within a window frame. It's fast, easy and without any pipes or ducts.
